# Group Members

## Head

Kurt Tutschku (since 01.09.2008)

## Administration

J. Baier-Mathews (secretary)

O. Michel (system admin.)

## Full Time Scientific Staff (senior staff and Ph.D. students)

Florian Metzger (from 01.05.2010)

Albert Rafetseder (from 01.03.2009)

David. Stezenbach (from 01.10.2010)

N.N. (advertised)

## Student Helpers

M. Alberer, B. Grubor, A. Lukovics, L. Pühringer, S. Seebacher, C. Vorhemus

## Post-Graduates (temporary scientific staff, Ph.D students)

Dominik Klein (Univ. of Würzburg, Germany, Mar. 1<sup>st</sup> - Aug. 31<sup>st</sup>, 2009)

Ricardo Matos (Univ. of Aveiro, Portugal, Apr. 1<sup>st</sup> - Jul. 15<sup>th</sup>, 2009)

Christian Schwartz (Univ. of Würzburg, Germany, Mar. 1<sup>st</sup> - Sep. 31<sup>st</sup>, 2010)

## Collaboration with external Ph.D. students

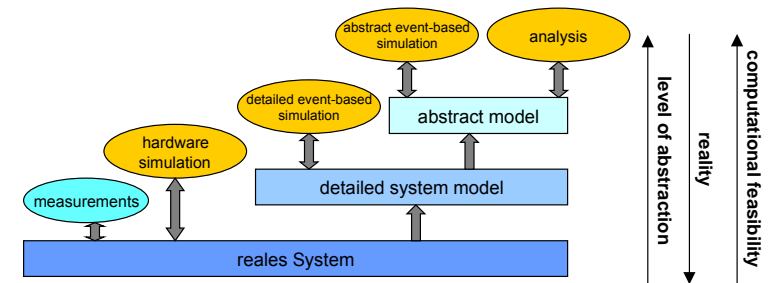

Thomas Zinner (Univ. Würzburg)

# Research Topics

- Future Internet, network virtualization
- Future network control plane
- P2P content distribution (mobile, wireline)
- Quality-of-Service and Quality-of-Experience
- Future Internet services, service virtualization and Internet of Things
- Traffic-oriented network management
- Performance evaluation (Event-based Simulation, Analysis)
- P2P algorithms (mediation, resource exchange), self-organization

|------------------|-----------------------------|------------------------|-------------------|
| Future Services  |                             |                        |                   |
| Future Transport |                             |                        |                   |
|                  | Architectures and Protocols | Performance Evaluation | Self-Organization |

# Partners

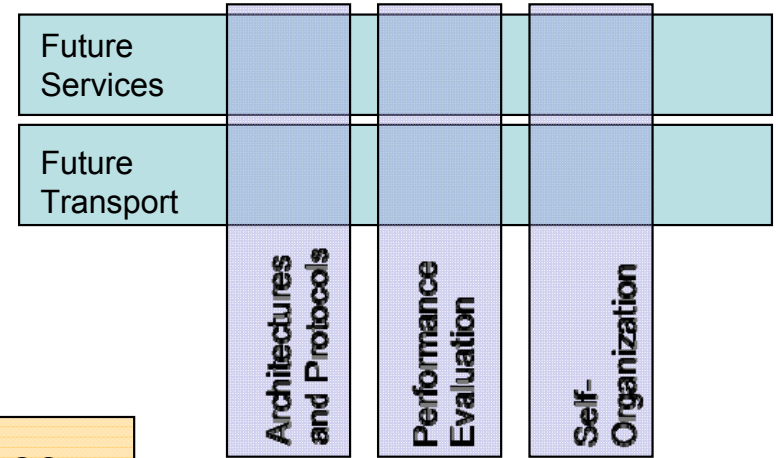

# Milestones (2008-10)

- Renewal of Endowment by Telekom Austria
- Research contract with NSN
- 2009: two journals, four conf. papers
- 2010 (so far): one journal, one book chapter, two conf. paper
- First EuroNF Specific Joint Development and Experimentation project
- Demo at GENI Engineering Conference 7 (Mar.'10)
- WWTF project on NV, Federation and Optimization (3years)

# Research and Teaching Instruments

## Future Transport Lab

## Future Services Lab (planned)

## Vienna Think Tank for Future Communication

- Focus on industry collaboration
- Endowed by Telekom Austria

## Academic Excellence

- Complementing courses in Bachelor prog.
- Ph.D. courses
- School of Internet Architects?

## Milestones

- Two EuroNF funded Ph.D. courses (Simulation, 2009; Network Virtualization, 2010)
- (Re)-engineering of 5-6 lectures (Rechnernetze, Netzwerktech. f. MA,, Simulationstechnik, OS & Algo. f. VNS, Sys. Arch f. zukünftige Netze)
- 17 Bachelor theses in 2009-10
- Contribution to curricular program

Chair of Future Communication

universität wien

# Involvement in Future Internet Activities

Collaboration with the following Future Internet projects:

- Akari (Japan, K. Tutschku was member of NICT)
- [EuroNF \(Europe, Strategic Officer, WP leader\)](#)
- G-Lab (Germany, application and association)
- OneLab2 (Europe, association)
- GENI/PlanetLab (USA, listener/member, participant to GEC3/4/6/7)
- [Setup of first GENI/GpENI-Nodes in Austria \(subproject of GENI\)](#)
- Invited talk on Network Virtualization at Future Internet Cluster (FIC 2010)
- [Advisory board European PPP project "Future Internet"](#)
- Invited talk on Comparison FI Architectures at EU-sponsored Future Internet Assembly (FIA 2010)
- Invited talk on Network Virtualization at DFN-Forum 2010
- [Co-Lead in Austrian FI PPP application](#)
- [Member of EuroNF steering board](#)

Lead or participation in the following Future Internet workshops

- 20<sup>th</sup> ITC Specialist Seminar on Network Virtualization (TPC Chair)
- Network virtualization workshop at KIVS'09 (TPC)
- Network virtualization (VISA) workshop at Sigcomm'09 (Reviewer)
- [VISA workshop at Sigcomm'10 \(TPC\)](#)
- Track Chair for Network Virtualization at the Future Internet Symposium (FIS 2010)
- Reviewer for EU FP7 program for Future Internet projects

# How to Evaluate and Compare Architectures: State of the Art and Beyond

K. Tutschku (kurt.tutschku@univie.ac.at) and G. Haring (guenter.haring@univie.ac.at)

Endowed by

- ▶ Introduction: the Internet and Future Internet
- ▶ What is an architecture?
- ▶ Comparison and evaluations of architectures
  - Structure, comparison, and quality
  - Formulation of metrics
  - Relation of attributes and multi-dimensional evaluation
  - An evaluation recipe
- ▶ Conclusion

universität  
wien

# The Future Internet Architecture?

Chair of  
Future Communication

endowed by

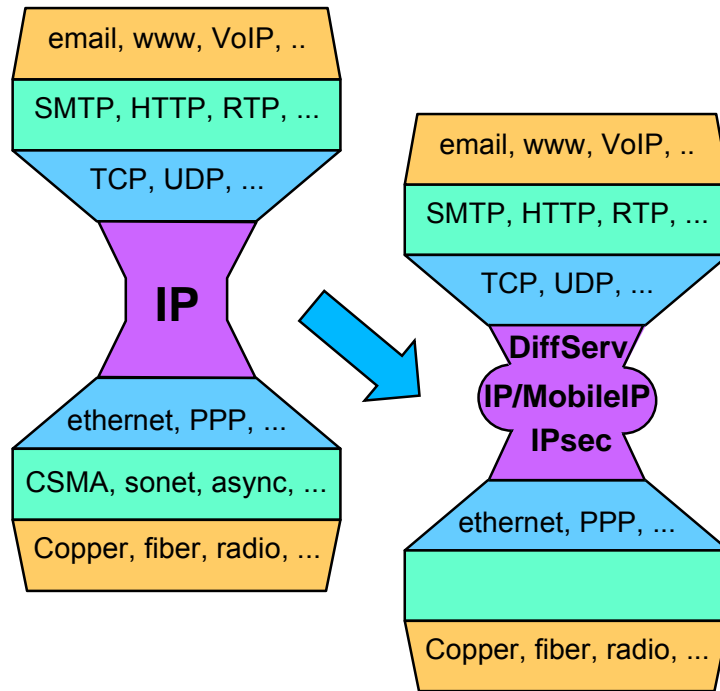

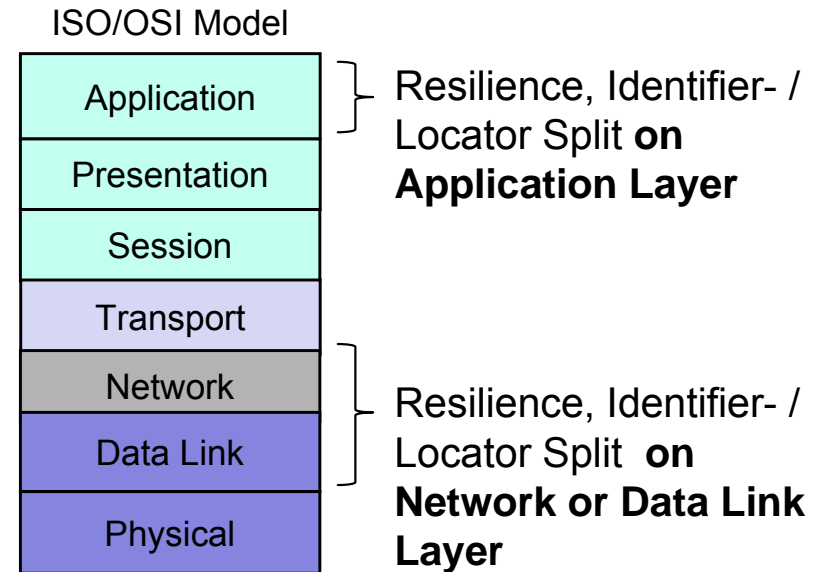

# IP „Hour Glas“ Architecture and other Reference Concepts

## Functional Overload

## Functional Ambiguity

- ▶ We probably **need** a new reference architecture!
- ▶ How to separate fcts? An where to place fcts?
- ▶ Which architecture is „**better**“, i.e. „**A > B**“
  - Mapping to a numerical scale?
- ▶ What is an **architecture reference model**?

# What is Architecture?

## Museums

## Churches

## Train Stations

- ▶ Each architecture/system has a specific purpose!
- ▶ Louis Sullivan: “**Form (ever) Follows Function**” → set of requirements (multi stakeholder goals)
- ▶ Is it possible/feasible to to compare architectures for different purposes? Or different views of one architecture?
- ▶ If yes, under which which circumstances, constraints, conditions, ... ?
- ▶ Normalization/coordination is required! What are the interfaces?

universität  
wien

# What is Architecture?

## Tower of Babel

Chair of

Future Communication

endowed by

# What is a Reference Model?

- From software architecture: OASIS (Organization for the Advancement of Structured Information Standards, 1993-2009): *Reference Architecture Foundation for Service Oriented Architecture* (Version 1.0)
  - Abstract framework for understanding **significant relationships** among entities of some environment
  - Consists of a **minimal set** of unifying concepts, axioms and relationships within a particular problem domain
  - Is **independent of specific technologies**, standards, implementations, or other concrete details.

# Structure and Comparison

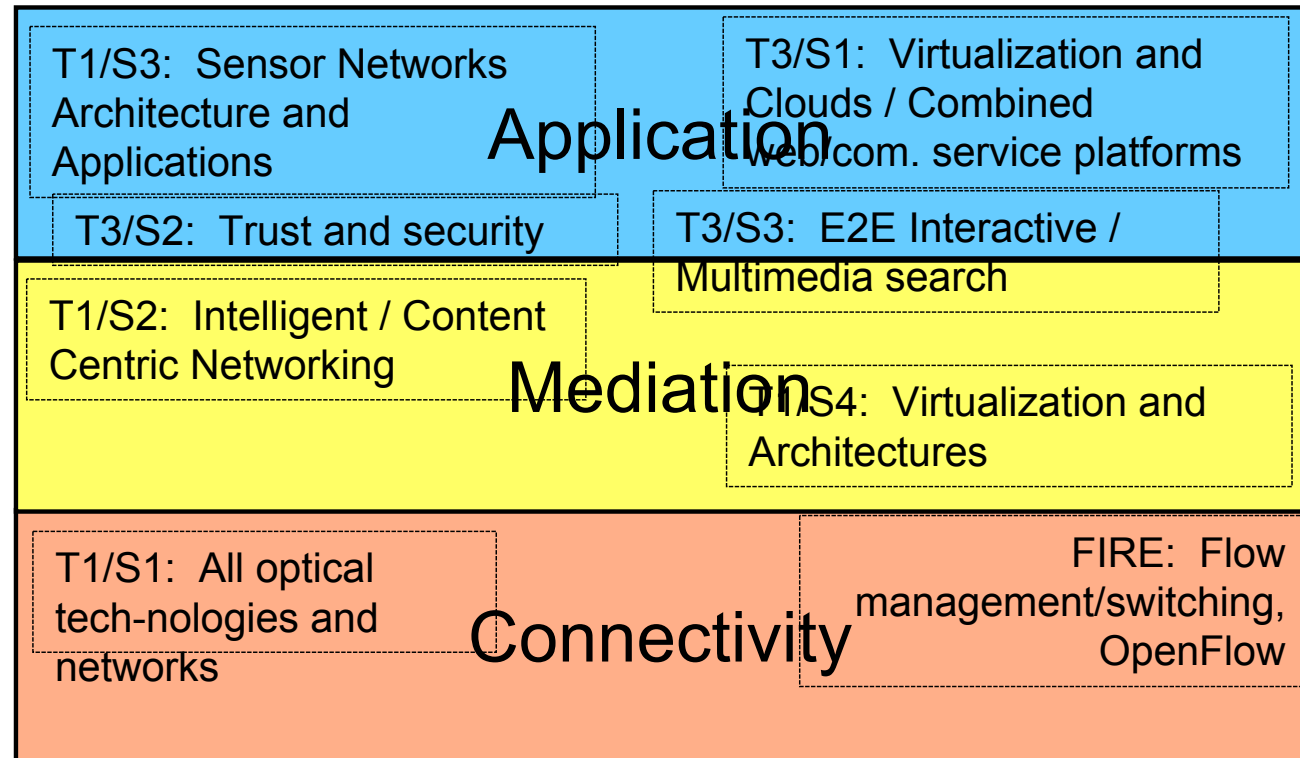

- **Separation of Concerns** (E. W. Dijkstra, 1974; C. Reade, 1989)
  - **Concern**: any piece of interest or focus in a program
  - Process of separating a computer program into distinct features that overlap in functionality as little as possible
  - “... isolation for the sake of its own consistency ...”
  - Achieved by **modularity** and **encapsulation**; facilitated e.g., by layered designs; other concept possible (“heaps” instead of “stacks”, e.g. Braden, Faber and Handley, ACM Sigcomm CCR, Jan. 2003 )

# Example: Separation of Concerns

- **Is a simple three-layer architecture suitable?**
  - Classification of project sessions at 3rd EU-Japan Symposium on Future Internet (Oct. 2010)

- At least suitable for strategic decisions
- Concerns guide also selection of **quality attributed**

Chair of Future Communication

endowed by

# Compare Quality of Architectures

- **Quality** (from Latin *qualitas*): an attribute or a property. Attributes are ascribable (by a subject), whereas properties are possessable.
  - Depends on criteria applied to it.
- **Quality** as defined **by ISO 9000**: “Degree to which a set of inherent characteristics fulfills requirements”
- **Quality of Architectures**
  - Non-functional quality: how an architecture is **supposed to be**
    - Fault-tolerant, backward compatibility, extensibility, maintainability, availability, security, usability, flexibility (e.g. for the **Polymorphic Internet**) ...
    - **Hard to quantify**
  - Functional quality: what a architecture is **supposed to do**
    - Fast, efficient, required/consumed resources
    - **Easier to quantify**

# How to Measure and Evaluate Quality?

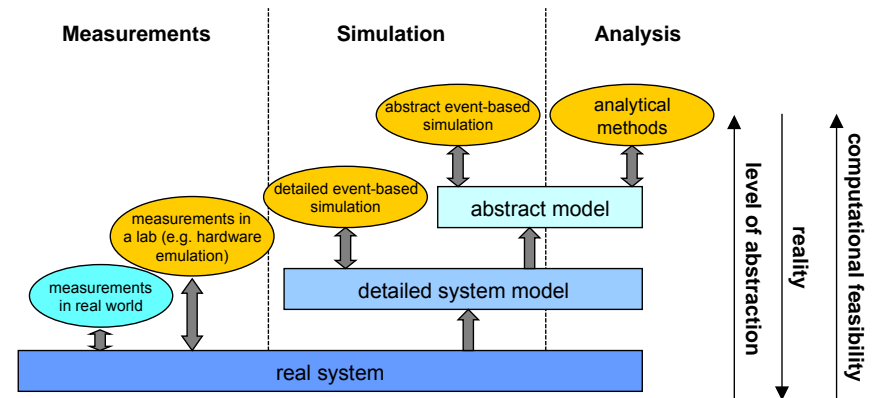

- **Basis: measurable quality attributes for architectures (features)**
  - Various characteristics, metrics, dimensions, ...
  - For example: load, throughput, MTBF, ...
- In general two alternatives:
  - feature **is measurable** or
  - feature **can be made measurable**
- Overall **quality model**: *systematic (e.g. weighted, normalized) combination of quality features*
  - Quantification of obligatory, mandatory, or elective features
- **Formulation of axioms for quality metrics**

# Formulation of Quality Metrics

- Relatively easy: **numerical performance evaluations** of architectures wrt QoS (loss, delay) and eventually QoE (MOS)

- Problem: **vaguely defined quality attributes for architectures,**
  - Example “maintainability” → **In general:** which measurable attributes determines the quality subject and in which way they related with the subject?
- Need: **Goal-oriented derivation of appropriate metric** (with minimization of the cardinality of the attribute set)
  - Be appropriate for the context! → Context may vary

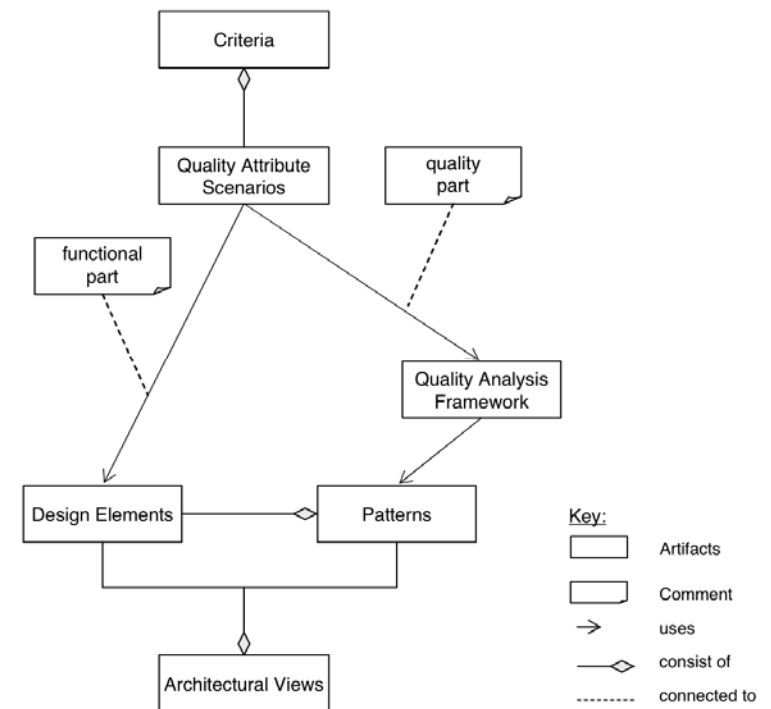

# Formulation of Quality Metrics

From software design and evaluation: **SACAM framework**(Software Architecture Comparison Analysis Method; C. Stoermer, et al., 2003)

- Reasoning as to whether quality attributes are satisfied by an architecture candidate
- Assistance in searching for particular indicators in the architectural documentation

→ Score each architecture on a scenario basis

# Relation of Quality Attributes

- **Cause-and-Effect Graph**

- Separation into measurable sub-metrics
- Specify causes and effects for sub-metrics (Div&Conq)

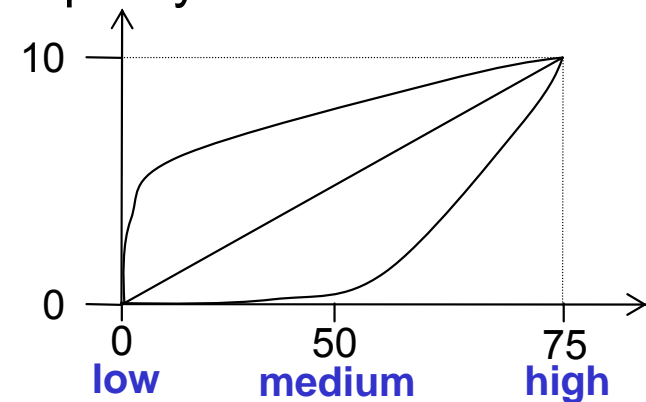

- Various relationships: arithmetic/geometric mean, etc.

- **Identify functional relationships**

- Define **Score Functions**, e.g. with normalized value range [0...10], for score of quality attributes

- Numerical values
- **Properties**

Chair of Future Communication

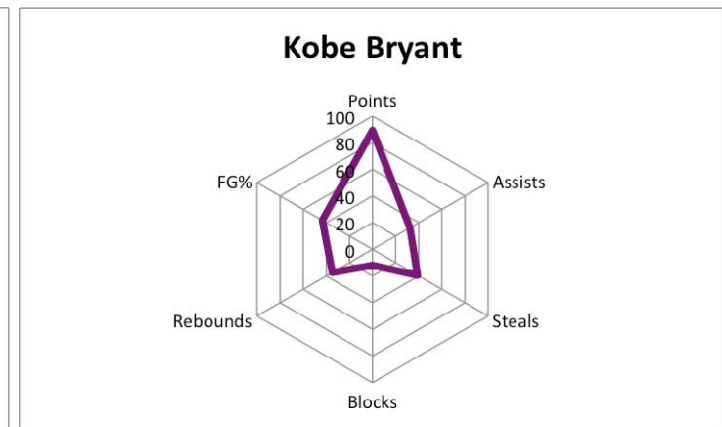

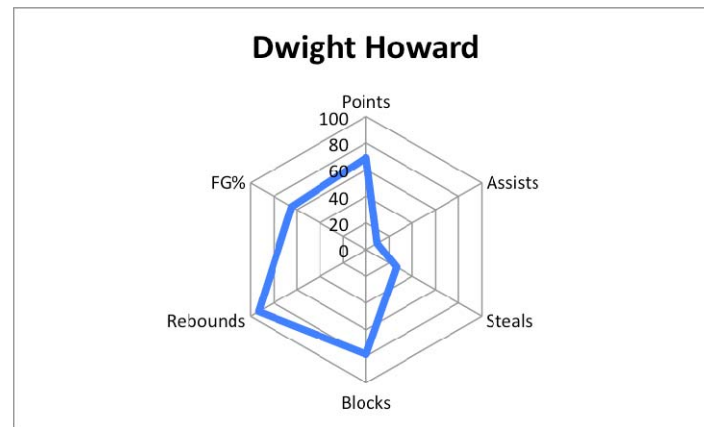

endowed by

# Multi-Dimensional Evaluation

- Problem: **Comparison of scores N dimensions**
- **Radar (Kiviat) graphs or star plots** (Chambers, 1983)
  - Displaying multivariate data, each star represents a single observation.
  - Typically, multi-plot format with many stars on each page and each star representing one score with many dimensions

# A First Architecture Evaluation Recipe

- Acknowledge the plurality of Future Internet architectures  
→ define and apply *comparison scenarios*
- Make **causally determined decisions on**
  - Cause-and-effect graphs
  - Specify scoring dimensions and scoring functions and determine weights
  - Compute base quality/performance attributes by mathematical performance analysis
  - Use multivariate comparison

Chair of  
Future Communication

endowed by

## Conclusion

- **Presentation of various comparison methods from a variety of disciplines**
  - Network design, software design, operations research, ...
  - Comparison based on scenarios (= **no unified architecture?**)
- **Identify causal relationships (= multi-disciplinary modeling)**
  - **Many open questions**
    - Specification of metrics, e.g. for dynamic networks with node churn
    - Which and how many quality dimensions are needed?
    - Is relative comparison sufficient? (no absolute values)
    - How to do **sensitivity analysis?**
      - **May improve the “separation of concerns”!**
